

# 2018 DataHaven Community Wellbeing Survey

## Valley Region Crosstabs

### Results Overview

These crosstabs contain data collected through the 2018 DataHaven Community Wellbeing Survey's live, in-depth interviews with 16,043 individuals statewide, including 1,044 in the Valley Region. The survey assessed topics such as health, employment, and neighborhood resources. Respondents spanned a broad range of ages, ethnicities, and socioeconomic statuses from every Connecticut zip code, and all results are based on weighting survey data to be representative of the entire adult population (see methodology). Data collected at this level reveal local trends in quality of life, including these examples:

**Young adults and non-white adults are within walking distance of more amenities:** In the Valley Region, 47% of adults are within walking distance of amenities like stores and banks. This is higher than the statewide figure (54%). But, certain demographics find themselves more conveniently situated. Sixty-one percent of adults between 18-34 and 59% of non-white adults are in walking distance of amenities. These demographic groups also find that it is safe to walk on the sidewalks/crosswalks in their neighborhoods (59% of adults between 18-34 and 62% of non-white adults, compared to 47% of Valley adults overall.)

### Younger adults, non-white adults see more amenities in walking distance

Percent of Valley adults with stores, etc. in walking distance by age and race, 2018

**Local government is listening to constituents more:** People were generally ambivalent about local government: Around half reported that their local government's responsiveness was good or excellent. But 71% felt they were able to influence government decision-making at least a little, and this was an 11 percentage-point increase from the last iteration of the DataHaven survey in 2015, suggesting that trust in local civic engagement is on the rise. This increase was even more pronounced among lower-income (under \$30,000) and higher-income (\$75,000 or more) adults, who saw 11- and 14-percent jumps, respectively.

### Growing shares of adults feel heard by local government

Percent of Valley adults reporting having at least some influence over local government by income, 2015-2018

**Higher-earning adults report better health:** Among individuals with annual incomes greater than \$75,000, 29% reported excellent health, compared to 14% reporting the same among individuals with incomes below \$30,000. Every health condition included on the survey was more prevalent in lower-income respondents, including hypertension, diabetes, heart disease/heart attack, and asthma.

### High-income adults rate their health more highly

Responses to self-rated health by income; percent of Valley adults, 2018

Rating ■ Excellent ■ Very good ■ Good ■ Fair ■ Poor

## How To Read This Document

The data in these crosstabs represent question-by-question weighted estimates, disaggregated by various demographic and socioeconomic characteristics. Each estimate represents how a group of respondents—weighted to be representative of the population within the specified geographic area—answered the question shown.

Please use caution in interpreting the information here, and consider the limitations of the populations from which the data was collected. In particular, please be aware of “skip patterns” in the survey, such as “Q23E1. (If still have asthma) During the past 30 days, how often have you used a prescription asthma inhaler during an asthma attack to stop it?” Only the subset of adults who indicated in the previous two questions that they had been diagnosed with asthma and still have it would have been eligible to receive this question. Therefore, the estimates show the percentages of adults with “current asthma” who have used inhalers, not the percentages of all adults who have used them.

The number of respondents to any given question is represented by “Weighted Total.” For example, many questions were answered by all 1,044 Valley Region respondents, so in the Valley Region column you will see a Weighted Total of 1,044. But the columns for each smaller population group (e.g., adults age 18-34) or the columns for questions that were asked only to a subset of adults will have smaller weighted totals. Generally, columns with demographic breakdowns are only included when the number of respondents completing that item was at least 50. Additionally, some questions were asked to special groupings of respondents or “ballots.” Respondents were randomly assigned to one of three statewide ballots (split 45%, 45%, and 10%) at the outset of the survey. For these questions (e.g., Q5, asked to 10% of adults, giving a Weighted Total of 114 people), weighted totals are generally smaller than they are for the questions that were asked to 100% of eligible respondents.

We recommend contacting DataHaven with any questions. DataHaven is happy to help you confirm whether the information in this document is being interpreted in a correct way, and possibly to recommend further analysis that might be useful to your work.

## Methodology

The DataHaven Community Wellbeing Survey was designed by DataHaven in consultation with over 100 local, statewide, and national survey research experts and local partners, in many cases drawing upon questions commonly used in other surveys.

On behalf of DataHaven, the Siena College Research Institute (SRI) conducted the survey of 16,043 residents of the state of Connecticut, including 1,044 in the Valley Region (additional surveys were also completed in parts of New York State, but are not included in these estimates). Surveys were conducted from March 6 through November 29, 2018. Residents age 18 and older were interviewed from all 169 towns in Connecticut. Interviews were conducted in English and Spanish. The overall Connecticut sample of 16,043 and the Valley Region sample of 1,044 were weighted by age, gender, reported race, and geography to ensure that they were statistically representative of the area’s demographics. In addition to demographic parameters, the samples were also weighted

to match current patterns of telephone status (landline only, cell phone only or both), based on the state-level estimates from the National Health Interview Survey.

Respondents were contacted via landline or cell phone. To ensure the selection of both listed and unlisted telephone numbers, the design of the sample incorporated random digit dialing (RDD). The cell phone sample was drawn from a sample of dedicated wireless telephone exchanges from within Connecticut. Approximately 1/3 of residents completed the survey on a cell phone. In addition to the traditional RDD samples for landline and cell, we augmented the sample using a stratified sampling technique. These stratified samples maintained RDD for both landline and cell but used information from the U.S. Census so as to enhance the composition of the sample, including targeted regions, urban centers, and high concentrations of minority populations. The primary supplier of the RDD landline and cell phone samples was Survey Sampling International (SSI) of Shelton, Connecticut. Additionally, for the cell phone sample we utilized SSI’s Wireless LITe database which uses billing address to enable the targeting of cell phone sample by region or zip code. This database also permitted the inclusion of non-Connecticut telephone numbers as someone may have moved and their billing address is in the area but their cell phone number is not a ‘typical’ Connecticut telephone number (i.e., not a 203, 860 area code). All of these respondents were screened by live interviewers to confirm their residence in a qualifying town and zip code before interviews continued.

## Reported Margins of Error

Margins of error are shown at the top of the crosstab. The “maximum” margin of error for the Valley Region sample of 1,044 adults is +/- 3.4% with a 95% confidence interval, including the design effects resulting from weighting. This means that in 95 out of every 100 samples of the same size and type, the results that we obtain would never vary by more than plus or minus 3.4 percentage points from the result that we would get if we could interview every single member of the adult population of Connecticut. This maximum margin of error applies when an observed percentage is 50%, and the margin of error becomes smaller as the percentage approaches the extremes of 0% or 100%. Margins of error are higher for small geographic or population groups.

## Contact Us

As a non-profit organization with a 25-year history of public service to Connecticut, DataHaven has a mission to help drive community action that improves quality of life. One way of doing so is by ensuring that data from this survey, as well as from other public data sources, are useful and accessible to the public. Contact us via email at [info@ctdatahaven.org](mailto:info@ctdatahaven.org) or via our website (<http://ctdatahaven.org/contact>). Extensive additional survey results are posted on our website.

**(If under 65 years old) The next few questions are about the national health problem of H.I.V., the virus that causes AIDS. Please remember that your answers are strictly confidential and that you don't have to answer every question if you do not want to. Although we will ask you about testing, we will not ask you about the results of any test you may have had. Have you ever been tested for H.I.V.?**

In the following questions, we are interested in the way other people have treated you or your beliefs about how other people have treated you. Can you tell me if any of the following has ever happened to you:  
 At any time in your life, have you ever been unfairly fired, unfairly denied a promotion or raise, or not hired for a job for unfair reasons?

	Connecticut		Valley Region		Gender				Age				Race/Ethnicity			Education			Income			Children in HH
